### **General Information**

The CORE  $^{PIR}$  sandwich panel consists of two galvanised steel sheets as the outer and inner lining of the panel and a PIR foam core, which is also the load-bearing and insulating layer. Double-sided galvanised steel sheet type S280GD or S320GD and zinc weight Z100 g/m2 for indoor use only and Z225 g/m2 or Z275 g/m2 for indoor and outdoor use. As a standard, the sheet is coated with a 25  $\mu$ m polyester coating. On special request, it can be coated with HDP35 or HDX55. The sandwich panel cladding is finished with a special film, which is designed to protect sandwich panels during transport, loading and unloading and during their storage in a warehouse or on the construction site. The core of the panel is rigid polyisocyanurate foam, abbreviated colloquially called PIR foam, which is characterised by increased fire parameters increasing fire safety and excellent thermal and acoustic insulation properties significantly increasing the quality of the constructed of modernised facility. The density of the foam is  $40\pm3$  kg/m3

### **Application**

Sandwich panels are a modern product with a very wide range of applications in today's construction industry. They are used to develop both roofs and facades of new buildings as well as modernised ones. They are also used for interior walls and ceilings, ensuring the freedom to arrange interior production, storage or office areas. Due to the excellent thermal conductivity coefficient:  $\lambda$ =0.022 W/mK, it is used, among others, in the construction of cold stores and freezers. Attractive colours and varied profiling allow for the design and construction of public utility facilities. This technology makes it possible develop buildings in a very short time and, in addition, due to its attractive price, allows the use of sandwich panels to be so common on today's developments.

According to the current Technical Conditions 2021, newly designed and constructed partitions should meet certain requirements. In the case of external walls, the legislator has classified this according to the temperatures provided for when using the rooms:

- for rooms > 8 °C coefficient UC=0.9 W/m2K
- for rooms between (8 and 16  $^{\circ}$ C) coefficient UC=0.45 W/m2K
- for rooms ≤ 16 °C coefficient UC=0.2 W/m2K

CORE PIR sandwich panels have a minimum insulation factor of  $\geq 24$  dB (-2, -4), this allows to use sandwich panels as a partition in many facilities, both industrial and public utility, thereby increasing the quality level of the facilities operated in accordance with the applicable standards in this respect.

CORE  $^{PIR}$  sandwich panels have been tested for their fire resistance by the relevant authorised testing bodies. They are NRO approved and have a very good fire resistance and reaction to fire class.

## General rules of panel assembly

Before starting the installation of sandwich panels, the following should be checked:

- compatibility of the load-bearing structure of the facility with the design
- whether the surface of the transoms is in one plane
- whether the elements of the load-bearing structure have been adequately protected against corrosion
- linearity and level of the plinth
- whether there is access for delivery trucks and space for manoeuvring the hoists or other devices which will be used for the assembly
- whether tools for the installation of sandwich panels and assembly control have been selected correctly and whether auxiliary tools have been completed
- checking the authorization of workers to perform specific works in this area and whether all workers have up-to-date safety training.

# Selection and application of connectors for the assembly of sandwich panels

The choice of fasteners must be in accordance with the designer's recommendations and verified for load-bearing capacity by the constructor; fasteners can be self-drilling or self-tapping but designed for the relevant material from which the load-bearing structure is made. The most common structures are reinforced concrete, steel and timber.

### **Coatings and colours**

Due to the possibility of different environmental conditions, it becomes very important to correctly choose and apply a suitable coating for the external and internal cladding of sandwich panels. One of the criteria is the EN ISO 12944-2:2001 standard, which defines the corrosivity categories: C1, C2, C3, C4, C5-l and C5-M. The corrosivity category specified in the project is a guideline, which must be followed when choosing the appropriate coating.
